## Amendments to the Specification

Please amend the paragraph beginning at line 150 (line 18 of page 7), which begins with the phrase "The cap body 20 has curved sides . . ." as follows:

The cap body 20 has curved sides that partially narrow the cap body 20. Further, the cap body 20 includes two side walls 21 extending along the sides of the cap body 20 with respect to the lateral direction of the cap body 20. The lateral direction of the cap body 20 refers to a direction perpendicular to the axis of the pin 15 (the lateral direction in Fig. 1). Two cover walls 22 extend between the side walls 21 and are spaced from each other by a predetermined distance in a direction perpendicular to the cap body 20. The lateral direction perpendicular to of the cap body 20 refers to a direction parallel to the axis of the pin 15. The direction perpendicular to the cap body 20 refers to a direction perpendicular to the axis of the pin 15 (the lateral direction in Fig. 1). The basal portions of the two side walls 21 are curved toward each other. The cover walls 22 are plate-like and have lateral edges shaped in correspondence with the side walls 21. The distal sides of the two cover walls 22 are curved outward from a hypothetical plane P, which connects the distal ends of the side walls 21. A distal slit 23 extends longitudinally straight through the center of each cover wall 22 from the distal end to the middle portion of the cover wall 22 so as to divide the cover wall 22 into two halves. The distal slit 23 has a uniform width with respect to the longitudinal direction.
